Abstract: This presentation, suggests an analytical technique called the reduced differential transform method (RDTM) for solving the time-fractional Kawahara equation. The fractional derivatives are described in the Caputo sense. This method is applied to the numerical example. Thus, we have obtained numerical solution of time-fractional Kawahara equation. Numerical solution obtained by this method has been also compared with the known exact solution. The obtained outcomes show this method is very efficient, convenient and simple.

Acknowledgements. This work is supported by by Turkish Scientific and Technical Research Council (TUBITAK) and the Scientific Research Projects (BAP) office of Selcuk University.
